

Progress Report 4

Achieved Milestones

One of the additional features we wanted to include on top of our MVP was to enable embedding video. Embedding Vimeo and YouTube videos as resources in our application now works. We also have finalized and divided up the work for our UI design for the Project Edit page. We have designed the graphics for icons that will be used in this new page and are working on implementing a side bar that will enable users to toggle between different templates.

We have been working on redesigning the portfolio page to make the user experience and overall design more uniform.

Missed Milestones

None.

Difficulties

Deciding on design of the portfolio page and the project edit page, which needs to be fluid and intuitive

Changes to problem analysis and design

As mentioned above, we have discussed and finalized a more concrete design plan for our Project Edit page, which was the page we were unsure about previously. We have begun implementing features of the new UI design for this page.

We also have a new design for the portfolio page. We are planning on using One-Page-Scroll for the portfolio page to make the User Interface more fluid across all the pages in our application.

We added the ability to link code from github projects and import specific parts from a url, as opposed to simply using gists. This should be better since it will now allow us to link the viewer back to where the code came from so they can further examine.
